

# Block level element

A block-level element always starts on a new line, and the browsers automatically add some space (a margin) before and after the element.

A block-level element always takes up the full width of the page.

Two commonly used block elements are: `paragraph` and `div`.

The `paragraph` element defines a paragraph in an HTML document.

The `div` element defines a division or a section in an HTML document.

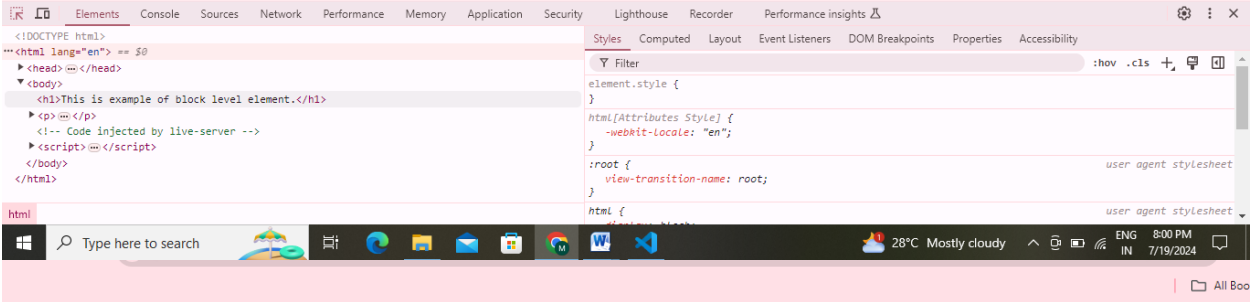

## Inline Elements

An inline element does not start on a new line.

An inline element only takes up as much width as necessary.

This is a `<span>` tag inside the paragraph.

## This is example of block level element.
